MEMORANDUM FOR: [REDACTED]
Chairman, COMIREX

SUBJECT : COMIREX Assistance on CIRIS Submission
for Satellite Imagery

1. The Consolidated Intelligence Resources Information System (CIRIS) provides the Director with a description of planned resource use by all elements of the Intelligence Community. It is the only comprehensive system available for providing such a description.

2. CIRIS utility has not reached the full potential designed into the system by [REDACTED] because data submissions have been of uneven quality. To correct this problem, [REDACTED] was brought in from Mitre Corporation to assist the IC Staff. [REDACTED] has had a great deal of success with "fixing" data bases in DoD, and has already implemented significant improvements in our procedures.

3. One of the deficiencies that he has noted concerns the manner in which satellite imagery resources are targeted against the CIRIS geographic/subject matrix. Currently this is done in the SOC by "counting frames" and prorating costs accordingly. There are two problems with this method. First, it implies that we are steering by observing the wake, since CIRIS is supposed to represent planned resource use for the current and two future years. Second, it assigns disproportionate resources to certain contingency targets [REDACTED] by allocating full, rather than marginal, costs to them.

4. It would clearly be preferable to obtain an estimate of planned use of each of the imagery systems. Hopefully, we could get a percentage distribution against a subject/geographic matrix that would accurately reflect management's expectation of what it is paying for. Such a distribution would be based on existing requirements tempered by judgment.
